CS2601 Linear and Convex Optimization Homework 5

Due: 2022.11.9

1. Let $\bar{B} = \{ \boldsymbol{x} \in \mathbb{R}^n : ||\boldsymbol{x}|| \le 1 \}$ be the closed unit 2-norm ball. Recall the projection of a point \boldsymbol{x}_0 onto \bar{B} is the solution to the following problem,

$$\min_{\bm{x} \in \bar{B}} f(\bm{x}) = \frac{1}{2} \|\bm{x} - \bm{x}_0\|^2$$

Use the first-order optimality condition to show that the projection of $x_0 \notin \bar{B}$ is $\hat{x}_0 = \frac{x_0}{\|x_0\|}$.

For the rest of of this assignment, we need CVXPY (https://www.cvxpy.org/).

2. Consider the optimization problem

$$\min_{x_1, x_2} \quad f(x_1, x_2)$$
s.t.
$$x_1 + 2x_2 \ge 1$$

$$3x_1 + x_2 \ge 1$$

$$x_1 \ge 0, x_2 \ge 0$$

Sketch the feasible set. For the objective functions in (a)-(c), first find the set of optimal solutions and the optimal value graphically, and then solve them using CVXPY. For the objective functions in (d) and (e), solve them using CVXPY. Show the outputs of CVXPY. Check the first example at https://www.cvxpy.org/tutorial/intro/index.html. You can use cvxpy.maximum(x,y) to get the maximum of two scalar variables x and y, or cvxpy.max(x) to get the maximum of the components of a vector variables x.

- (a). $f(x_1, x_2) = x_1 + x_2$
- (b). $f(x_1, x_2) = -x_1 x_2$
- (c). $f(x_1, x_2) = x_1$
- (d). $f(x_1, x_2) = \max\{x_1, x_2\}$
- (e). $f(x_1, x_2) = x_1^2 + 9x_2^2$

3. Consider the following optimization problem with $x \in \mathbb{R}^n$, $A \in \mathbb{R}^{m \times n}$, $b \in \mathbb{R}^m$.

$$\min_{\boldsymbol{x}} \quad \|\boldsymbol{A}\boldsymbol{x} - \boldsymbol{b}\|_{\infty}
\text{s.t.} \quad \|\boldsymbol{x}\|_{\infty} \le 1$$
(1)

- (a). Reformulate problem (1) as an LP.
- (b). Solve the original problem in (1) using CVXPY for m = 3, n = 2,

$$\mathbf{A} = \begin{pmatrix} 2 & 1 \\ 1 & 3 \\ 1 & 2 \end{pmatrix}, \quad \mathbf{b} = \begin{pmatrix} 5 \\ 6 \\ -5 \end{pmatrix}.$$

Show the output of CVXPY. To see how to use vectors and matrices in CVXPY, check the examples at https://www.cvxpy.org/tutorial/intro/index.html#vectors-and-matrices. The p-norm of a vector x is given by cvxpy.norm(x, p). Use "inf" to get the ∞ -norm. Alternatively, you can use cvxpy.norm2(x), cvxpy.norm1(x), cvxpy.norm_inf(x) to get the 2-, 1-, and ∞ -norms, respectively.

- (c). Solve the LP problem you find in part (a) using CVXPY. Show the output of CVXPY. You can check the example here https://www.cvxpy.org/examples/basic/linear_program.html.
- **4.** Let $\boldsymbol{w} \in \mathbb{R}^6$ and

$$\boldsymbol{X} = \begin{pmatrix} 4 & 1 & 0 & 4 & 2 & 0 \\ 2 & 4 & 1 & 1 & 0 & 2 \\ 4 & 4 & 0 & 4 & 1 & 4 \\ 1 & 0 & 2 & 3 & 1 & 2 \\ 4 & 4 & 2 & 2 & 0 & 1 \\ 2 & 2 & 0 & 1 & 2 & 4 \\ 0 & 1 & 2 & 1 & 4 & 2 \\ 0 & 0 & 1 & 0 & 1 & 3 \end{pmatrix}, \quad \boldsymbol{y} = \begin{pmatrix} 5 \\ 0 \\ 5 \\ 0 \\ 4 \\ 2 \\ 5 \\ 3 \end{pmatrix}.$$

Solve problem (a) with normal equation and problems (b), (c) with CVXPY and show the outputs.

(a). Linear least squares regression

$$\min_{\boldsymbol{w}} \|\boldsymbol{X}\boldsymbol{w} - \boldsymbol{y}\|_2^2$$

Remark. you can use any software, e.g. PYTHON or MATLAB, to solve the normal equation of (a).

(b). Lasso

$$\min_{\boldsymbol{w}} \quad \|\boldsymbol{X}\boldsymbol{w} - \boldsymbol{y}\|_2^2$$
s.t. $\|\boldsymbol{w}\|_1 < t$

for t = 1 and t = 10. In each case, is the solution the same as that of (a)? Is the solution sparse? Here 'sparse' means that, at a solution \mathbf{w}^* , we will have many components of \mathbf{w}^* equal to zero. (Note that there are numerical errors, which you should ignore when answering the questions.)

(c). Ridge regreesion

$$egin{array}{ll} \min_{oldsymbol{w}} & \|oldsymbol{X}oldsymbol{w} - oldsymbol{y}\|_2^2 \ & ext{s.t.} & \|oldsymbol{w}\|_2^2 \leq t \end{array}$$

for t = 1 and t = 100. In each case, is the solution the same as that of (a)? Does the solution have zero components? (Again ignore the numerical errors.)

Remark. Lasso tends to produce sparse solutions with zero components. See also Figure 2 of the Lasso paper (the document is on canvas)
